# Cleaning

# Workspace

```
library(here) # for working with files
library(tidyverse) # for cleaning
library(janitor) # for variable names
library(lme4) # for mulitlevel modeling
library(sjPlot) # for figures
library(ggpubr) # for prettier plots
library(kableExtra) # for nicer tables
```

Remove the following columns.

```
-recorded_date,
-external_reference,
-distribution_channel,
-user_language,
-starts_with("recipient"),
-starts_with("location"),
-starts_with("meta_info"))
```

### Recode personality item responses to numeric

We recode the responses to personality items, which we downloaded as text strings.

```
p_items = str_extract(names(data), "^[[:alpha:]]*_[abcd](_2)?$")
p_items = p_items[!is.na(p_items)]

personality_items = select(data, proid, all_of(p_items))
```

Next we write a simple function to recode values.

```
recode_p = function(x){
    y = case_when(
        x == "Very inaccurate" ~ 1,
        x == "Moderately inaccurate" ~ 2,
        x == "Slightly inaccurate" ~ 3,
        x == "Slightly accurate" ~ 4,
        x == "Moderately accurate" ~ 5,
        x == "Very accurate" ~ 6,
        TRUE ~ NA_real_)
    return(y)
}
```

Finally, we apply this function to all personality items.

```
personality_items = personality_items %>%
  mutate(
    across(!c(proid), recode_p))
```

Now we merge this back into the data.

```
data = select(data, -all_of(p_items))
data = full_join(data, personality_items)
```

#### Drop bots

#### Based on responses

We removed 4 participants without valid Prolific IDs.

We removed 0 participants that do not speak english well or very well.

#### Based on patterns

We remove any participant who provides the same response to over half of the items (17 or more items) from a given block in a row.

```
# first, identify unique adjectives, in order
adjectives = p_items %>%
  str_remove_all("_.") %>%
  unique()
# extract block 1 questions
block1 = data %>%
  select(proid, matches("^[[:alpha:]]+_[abcd]$"))
#rename variables
n = 0
for(i in adjectives){
  names(block1) = str_replace(names(block1), i, paste0("trait", str_pad(n, 2, pad = "0")))
block1 = block1 %>%
  gather(item, response, -proid) %>%
  filter(!is.na(response)) %>%
  separate(item, into = c("item", "format")) %>%
  select(-format) %>%
  spread(item, response)
block1_runs = numeric(length = nrow(block1))
# working on this!!!
for(i in 1:nrow(block1)){
  run = 0
  maxrun = 0
  for(j in 3:ncol(block1)){
    if(block1[i,j] == block1[i, j-1]){
      run = run+1
      if(run > maxrun) maxrun = run
      } else{ run = 0}
  block1_runs[i] = maxrun
}
#add to data frame
block1$block1_runs = block1_runs
```

```
# extract block 2 questions
block2 = data %>%
  select(proid, matches("^[[:alpha:]]+_[abcd]_2$"))
#rename variables
n = 0
for(i in adjectives){
 n = n+1
 names(block2) = str_replace(names(block2), i, paste0("trait", str_pad(n, 2, pad = "0")))
block2 = block2 %>%
  gather(item, response, -proid) %>%
  filter(!is.na(response)) %>%
  mutate(item = str_remove(item, "_2")) %>%
  separate(item, into = c("item", "format")) %>%
  select(-format) %>%
  spread(item, response)
block2_runs = numeric(length = nrow(block2))
# working on this!!!
for(i in 1:nrow(block2)){
 run = 0
  maxrun = 0
  for(j in 3:ncol(block2)){
   if(block2[i,j] == block2[i, j-1]){
     run = run+1
      if(run > maxrun) maxrun = run
      } else{ run = 0}
  block2_runs[i] = maxrun
#add to data frame
block2$block2_runs = block2_runs
#combine results
runs_data = block1 %>%
  select(proid, block1_runs) %>%
  full_join(select(block2, proid, block2_runs)) %>%
  mutate(
   remove = case_when(
      block1_runs >= 17 ~ "Remove",
      block2_runs >= 17 ~ "Remove",
      TRUE ~ "Keep"
    ))
#visualize
runs_data %>%
  ggplot(aes(block1_runs, block2_runs)) +
  geom_point(aes(color = remove)) +
  scale_color_manual(values = c("black", "red")) +
```

```
guides(color = "none") +
labs(
    x = "block 1 runs",
    y = "block 2 runs"
) +
theme_pubr()
```

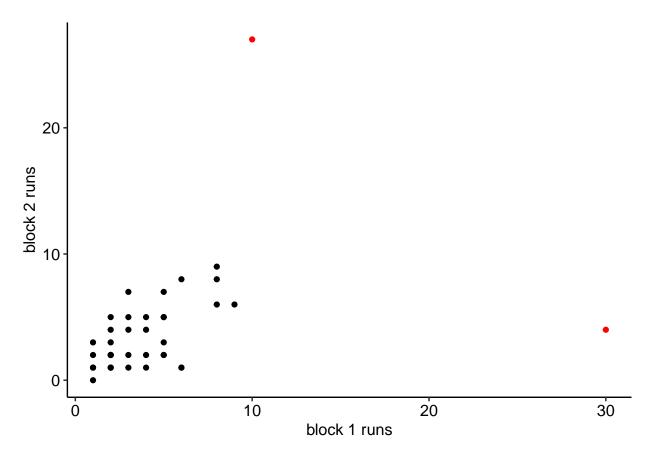

Figure 1: Maximum number of same consecutive responses in personality blocks.

There were 2 participants who provided the same answer 17 or more times in a row. These participants were removed from the analyses.

```
data = data %>%
  full_join(select(runs_data, proid, remove)) %>%
  filter(remove != "Remove") %>%
  select(-remove)

rm(runs_data)
```

#### Based on inattentive responding

We expect to exclude any participant who has an average response of 4 ("slightly agree") or greater to the attention check items. Two items from the Inattentive and Deviant Responding Inventory for Adjectives (IDRIA) scale (Kay & Saucier, in prep) have been included here, in part to help evaluate the extent of inattentive responding but also to consider the effect of item wording on these items. The two items used

here (i.e., "Asleep", "Human") were chosen to be as inconspicuous as possible, so as to not to inflate item response durations. The frequency item (i.e., "human") will be reverse-scored, so that higher scores on both the infrequency and frequency items reflect greater inattentive responding.

```
in_average = data %>%
  # reverse score human
mutate(across(matches("^human"), ~(.x*-1)+7)) %>%
  # select id and attention check items
select(proid, matches("^human"), matches("^asleep")) %>%
gather(item, response, -proid) %>%
filter(!is.na(response)) %>%
group_by(proid) %>%
summarise(avg = mean(response)) %>%
mutate(
  remove = case_when(
   avg >= 4 ~ "Remove",
   TRUE ~ "Keep"))
```

```
in_average %>%
  ggplot(aes(x = avg, fill = remove)) +
  geom_histogram(bins = 20, color = "white") +
  geom_vline(aes(xintercept = 4)) +
  guides(fill = "none") +
  labs(x = "Average response to inattention check items") +
  theme_pubr()
```

We remove 1 participants whose responses suggest inattention.

```
data = data %>%
  full_join(select(in_average, proid, remove)) %>%
  filter(remove != "Remove") %>%
  select(-remove)
```

#### Reverse score personality items

The following items are (typically) negatively correlated with the others: reckless, moody, worrying, nervous, careless, impulsive. We reverse-score them to ease interpretation of associations and means in the later sections. In short, all traits will be scored such that larger numbers are indicative of the more socially desirable end of the specturm.

```
data = data %>%
  mutate(
    across(matches("^reckless"), ~(.x*-1)+7),
    across(matches("^moody"), ~(.x*-1)+7),
    across(matches("^worrying"), ~(.x*-1)+7),
    across(matches("^nervous"), ~(.x*-1)+7),
    across(matches("^careless"), ~(.x*-1)+7),
    across(matches("^impulsive"), ~(.x*-1)+7))
```
